

Week 7:

Error:

```
washu2_ram.vhd:76:27:error: no declaration for "ram_mem"
  attribute ramstyle of ram_mem : signal is "block";
      ^
```

Fix: put the line later after declaration

Error:

```
washu2_cpu.vhd:105:14:error: choice subtype is not locally static
  with std_logic_vector'(bus_pc &
      ^
```

Fix: need to declare a new signal; error is because std_l... isn't constrained by size.

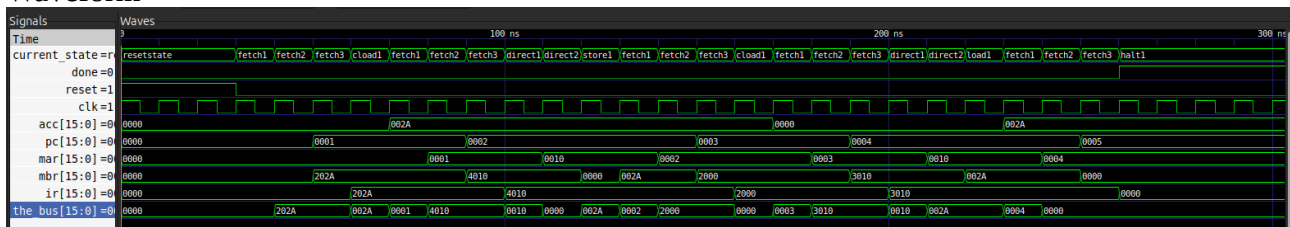

Error:

fetch2: mbr reads from bus, mar not updated yet.

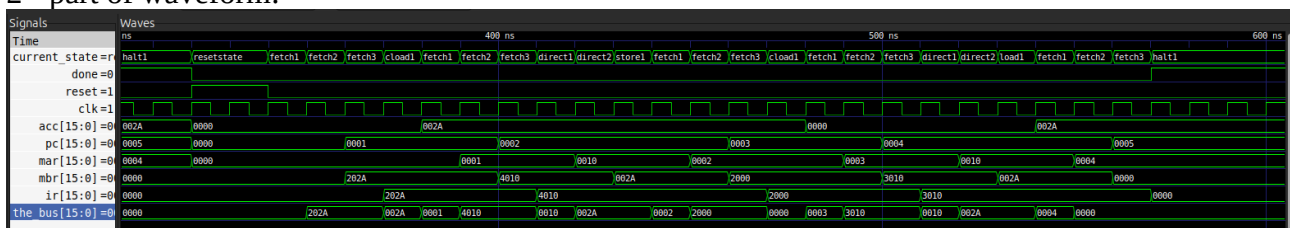

Fix: The ram_addr signal was missing. Made changes accordingly.

This fixes the error because now we don't need to wait an extra cycle for mar to update, ram_addr gets the info from the_bus and doesn't have to wait for clock rising edge.

Waveform
